Descripción

We are a leading provider of microbial technologies with a strong food-ingredients portfolio. Our core competency is the development and commercialization of microbial strains and metabolites for the agri-food, chemical and pharmaceutical sector. ADM Biopolis is part of Archer Daniels Midland and one of its 62 innovation centers.

Actividad

ADM Biopolis core expertise is finding, designing and developing microorganisms for industrial and health-related purposes. To develop ground-breaking products, our RD is based on a series of harmonized, interconnected research platforms. We aim to understand the complex relationship between microbiome and health. Our sequencing technology has enabled us to identify and understand this microbial diversity. There are a different number of health indications that are completely related to our microbial behavior and to our microbiome. We approach the development of microbiome solutions in a comprehensive way. We isolate, select, develop, and produce the right strains to initiate the specific alteration of the microbiome (dysbiosis) that is responsible for a particular health indication.
